

Table 4 Distribution of the power of 2 formulas in predicting birth weight < 2500 g

Formula	Sensitivity % (CI)	Specificity % (CI)	Positive predictive value % (CI)	Negative predictive value % (CI)
Fundal height × abdominal girth	70.4 (68.9–71.8)	79.9 (78.8–81.0)	98.7 (98.6–98.8)	11.0 (10.3–11.7)
Regression model of birth weight on fundal height	77.8 (76.6–79.0)	85.5 (84.6–86.4)	99.1 (99.0–99.2)	18.9 (17.8–20.0)

Cut-off point = 3000 g.

CI = confidence interval.
